Read the passage below and answer questions 26-38 Makau woke up to a rude shock. The home was deserted and the sheep and goats were not in their shed. The sun was already high up in the sky and birds had migrated in search of food.

Makau was lost on what to do. Then he remembered that horn that his father blew every time there was an emergency. He was surprised to find his father's "body" hanging where the horn was. The horn was missing. immediately he realised that they had been raided. "How could I not have heard anything?" he thought to himself. the other men of the village had been killed by the manly plague. For a while, he stood rooted to the ground; then he made up his mind to go after the raiders. He believed he would get them and fight them since he had a special gift of sensing and smelling things that were at a far distance. A few kilometers away from home, he heard women wailing and asking for help. He tracked them down following the sound of the wails. He found them locked in an old grass thatched cage. Makau used his expertise to open the door and asked for the direction the raiders took.

The women were sent to take their children back home and to send men from the neighbouring villages to go and help Makau. In less than an hour, Makau found the raiders and with the help from the neighbours he managed to

#### Read the following passage and then answer questions 39-50

The world's largest passanger plane is the Boeing 747, also known as a Jumbo jet. It is 70 meters long and weighs nearly 320 tonnes.

The body of a plane is called a fuselage. Inside the fuselage of the Boeing 747 is the passengers cabin, with seats for about 400 people.

The pilot of Jumbo jet is called a captain. The captain has another pilot to assist. This is his or her co-pilot. The two pilots sit in a section towards the front of the plane called flight deck. In the flight deck there is also an automatic pilot, a computer which can fly the plane!

The Boeing 747 has wings which measure 60 metres from tip to tip

The plane has four jet engines, mounted two beneath each wing.

How can such a heavy machine, carrying so many people, fly and stay in the air? One of the wings that helps aeroplanes to fly is the engine Jet engines force hot gases out behind them at great speed. These push the plane in the opposite direction. To see this effect, blow some air into a balloon and hold the end tightly. When you let go, the force of the escaping air will send the ballon forward.

Aeroplanes are also helped to fly by their wings. The wings have a special shape called aerofoil. This means that they are curved move above than below. Air flows faster over the aerofoils curved upper surface than beneath it. This creates a force called lift, which enables the plane to fly.

Helicopters fly in a different way. They can hover in mid-air and fly in any direction-even backwards! instead of wings, they have spinning blades called rotors. These act as wings and propellers to give them lift and thrust. Helicopters pilots control their craft by changing the pitch, or angle, at which the rotor blades spin through the air, because they can hover and fly straight up or down, helicopters are especially useful for rescue work.
